What is Stem cell

Stem cells are groups of cells that are found in the beginning of life all the way to the end. Stem cells are able to become many types of cells ranging from skin cells to even organs. As the person grows the stem cells are less manipulatable. When the egg is fertilized the stem cells are able to become anything. When the human is born the stem cells are able to become only a few things.

Cloning

How can we use stem cells to monetize cancer treatment?

LET'S Clone

Pros

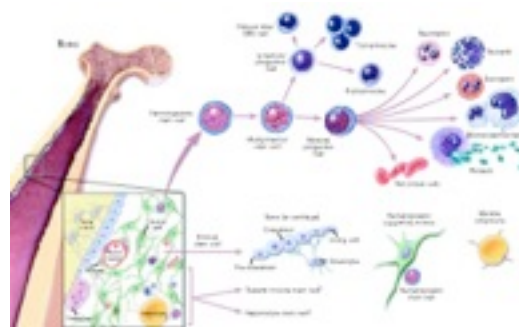

When women are not able to get pregnant doctors are able to preform in vitro fertilization to make the woman pregnant. This is a process where the woman's eggs are fertilized out side of the body then placed back in the woman's body When the woman gets in vitro many eggs are fertilized but only a few are use. Some scientist use these extra eggs to collect stem cells with could help with cancer treatment and other diseases.

Stage 1
You and your partner have been trying to have a child but are unable to get pregnant. Now you look to in vitro fertilization for

Stage 2
The doctor takes many from the woman then implants a couple. The rest are saved for a future babies if you chose to have them.

Stage 3
Your partner and you decide that one baby is enough. Now you allow the doctor to use the extra eggs to harvest embryonic stem cells to help cancer treatment.
